

MAIZE DDGS

PRODUCT DESCRIPTION:

Distiller's dried grains with soluble (DDGS) are the dried residues remaining after the starch fraction of Maize is fermented with yeasts to produce ethanol. DDGS is high in protein (29% - 34%) of which 55% is rumen bypass.

The high energy level in DDGS is derived predominantly from fibre and fat and does not cause any risk of developing acidosis. DDGS contains dried yeast cells from the distillery process that provides B-vitamins and an excellent palatability. As the solubles provide highly digestible microbial amino acids (15% of total protein), the total protein digestibility of DDGS is high.

The composition of the amino acid pattern, low in lysine and high in methionine, makes it highly compatible with other protein sources like soybean meal. Compared to Australian wheat DDGS, US maize DDGS has a higher energy and crude protein value.

FEEDING RECOMMENDATIONS:

The benefits of DDGS are best captured in a balanced feed ration. Possible inclusion rates depend upon achieving a nutritional balance, but typically up to 20% of daily DM can be achieved. In common with all distillery by products the residual cereal oil is unsaturated oil which can affect milk fat and feed efficiency at high levels. Consider other oil fractions in the diet when balancing.

DDGS can be fed mixed with your forages or fed via a blend in your shed.

Consult your local WSF Representative to work out the most optimal inclusion level for your particular situation.

STORAGE AND HANDLING :

Like all feedstuffs, Maize DDGS should be stored dry, in bulk bins or placed on cement slabs, away from vermin and covered and protected from the weather accordingly.

TYPICAL ANALYSIS: (approx.)

ME	13-13.5	ME Mj/kg DM
Protein	29-34	%DM
Dry Matter	89	%
Crude Fat	8-9	%DM
NDF	34-36	%DM
